PHASE 1.1 DISTRICT BASELINE

Shiva Temple Discovery District Baseline Insights

A district-only baseline generated from active LGD district locations, Google Places discovery output, deduplication, and Shiva-confidence classification.

Important: these are discovery counts from Google Places API and name-based classification, not exact real-world temple counts or an official cultural census.

UNIQUE GOOGLE PLACE IDS	HIGH-CONFIDENCE SHIVA	HIGH + MEDIUM SIGNAL
74,117	**43,877**	**51,243**
Deduplicated candidate records	59.2% of unique candidates	69.1% of unique candidates

Generated: May 17, 2026 02:24 PM | Source: Google Places API (district active locations only) | Status: district_level_discovery_count_not_final_cultural_count

Executive Summary

DISCOVERED OCCURRENCES

229,495

Raw result-count total from completed search tasks

DUPLICATES REMOVED

155,378

67.7% of discovered occurrences

CANDIDATE EXPORT ROWS

74,117

Rows in candidate_review.csv

STATES / UTS

36

Rows in state_counts.csv

DISTRICT ROWS

772

Rows in district_counts.csv

LOW-CONFIDENCE POSSIBLE TEMPLES

22,874

30.9% of unique candidates

What The Data Says

- The pipeline reduced **229,495** discovered occurrences to **74,117** unique Google Place IDs, which is a strong signal that cross-query deduplication is doing real work.
- **51,243** candidates are high or medium confidence by name classification, representing **69.1%** of the unique candidate set.
- The top five states by unique discovered candidates account for **38.1%** of the current candidate set; the top ten account for **61.6%**.
- **Uttar Pradesh** currently has the largest unique candidate volume, while **Uttar Pradesh** has the largest high-confidence count.

Confidence Mix

High 59.2% Medium 9.9% Low 30.9%

43,877
High-confidence names

7,366
Medium-confidence names

Low confidence is a review queue, not a negative label. It means the candidate name did not match the configured Shiva terms strongly enough.

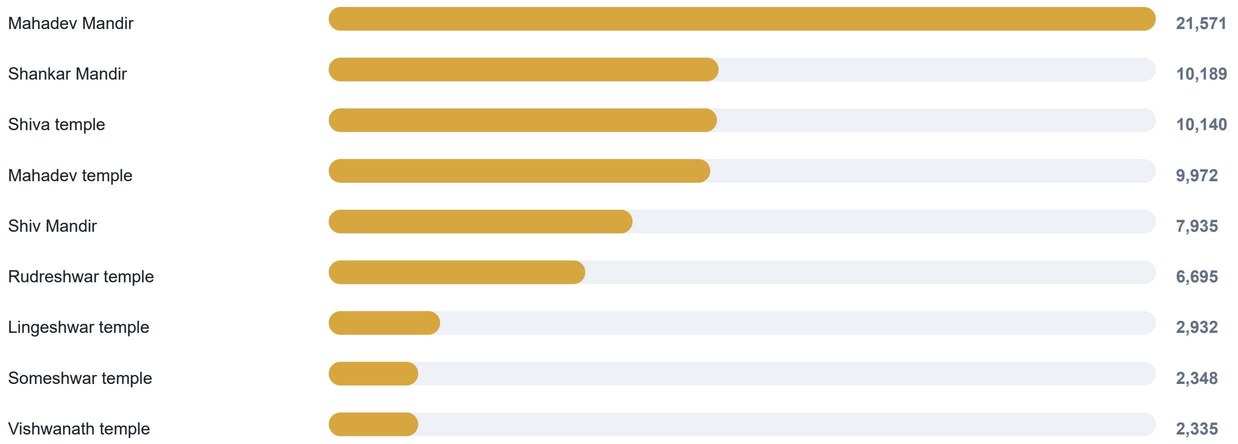
Bihar	Bhojpur	128	82.1%	156
Bihar	Madhubani	128	69.6%	184

Query Signal

Last Recorded Source Query Keywords



How To Read This

The keyword distribution comes from **candidate_review.csv**. Because candidates are deduplicated by Google Place ID and rediscovery can update the stored source query, this is best read as the latest recorded query signal for unique candidate rows, not as full attribution across every API occurrence.

The strongest keyword signals in this export are direct Shiva and Mahadev variants, followed by Shankar and other configured Phase 1 terms.

KEYWORD	CANDIDATE ROWS	SHARE OF UNIQUE
Mahadev Mandir	21,571	29.1%
Shankar Mandir	10,189	13.7%
Shiva temple	10,140	13.7%
Mahadev temple	9,972	13.5%
Shiv Mandir	7,935	10.7%
Rudreshwar temple	6,695	9.0%
Lingeshwar temple	2,932	4.0%
Someshwar temple	2,348	3.2%
Vishwanath temple	2,335	3.2%

Interpretation Notes

What This Report Is Good For

- Prioritizing states and districts for manual review.
- Spotting where duplicate discovery is heavy and deduplication is valuable.
- Understanding how much of the current candidate set has strong Shiva-name evidence.
- Choosing the next controlled Google Places discovery batches.

Limits And Caveats

- Google Places is a discovery source only. The output should be verified with additional sources before publication.
- Confidence is based primarily on discovered names. A low-confidence row may still be a Shiva temple.
- Google Place IDs help deduplicate API results, but they do not prove cultural completeness or canonical temple identity.
- Counts can change when more search tasks are run, when Google updates Places data, or when classification terms are refined.

Suggested Next Moves

- Review the highest-volume districts first, especially where high+medium share is strong.
- Sample low-confidence rows in high-volume states to improve classification terms.
- Run remaining pending search tasks in small batches and regenerate this PDF after each batch.
- Keep village-level expansion separate and intentional because it will rapidly increase task volume.

Input files: national_summary.csv, state_counts.csv, district_counts.csv, candidate_review.csv. Sample CSV files were intentionally excluded.
