PHASE 1 DISCOVERY REPORT

Shiva Temple Discovery Consolidated Insights

A single report generated from the non-sample CSV exports in **reports/**, summarizing Google Places discovery output, deduplication, confidence classification, and geographic concentration.

Important: these are discovery counts from Google Places API and name-based classification, not exact real-world temple counts or an official cultural census.

UNIQUE GOOGLE PLACE IDS	HIGH-CONFIDENCE SHIVA	HIGH + MEDIUM SIGNAL
98,163	**54,517**	**63,639**
Deduplicated candidate records	55.5% of unique candidates	64.8% of unique candidates

Generated: May 12, 2026 09:51 AM | Source file status: discovery_count_not_final_cultural_count

Executive Summary

DISCOVERED OCCURRENCES

345,751

Raw result-count total from completed search tasks

DUPLICATES REMOVED

247,588

71.6% of discovered occurrences

CANDIDATE EXPORT ROWS

98,163

Rows in candidate_review.csv

STATES / UTS

36

Rows in state_counts.csv

DISTRICT ROWS

776

Rows in district_counts.csv

LOW-CONFIDENCE POSSIBLE TEMPLES

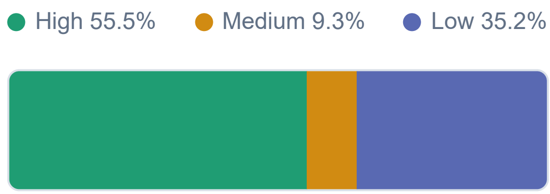
34,524

35.2% of unique candidates

What The Data Says

- The pipeline reduced **345,751** discovered occurrences to **98,163** unique Google Place IDs, which is a strong signal that cross-query deduplication is doing real work.
- **63,639** candidates are high or medium confidence by name classification, representing **64.8%** of the unique candidate set.
- The top five states by unique discovered candidates account for **51.3%** of the current candidate set; the top ten account for **70.4%**.
- **Uttar Pradesh** currently has the largest unique candidate volume, while **Uttar Pradesh** has the largest high-confidence count.

Confidence Mix



54,517

High-confidence names

9,122

Medium-confidence names

Low confidence is a review queue, not a negative label. It means the candidate name did not match the configured Shiva terms strongly enough.

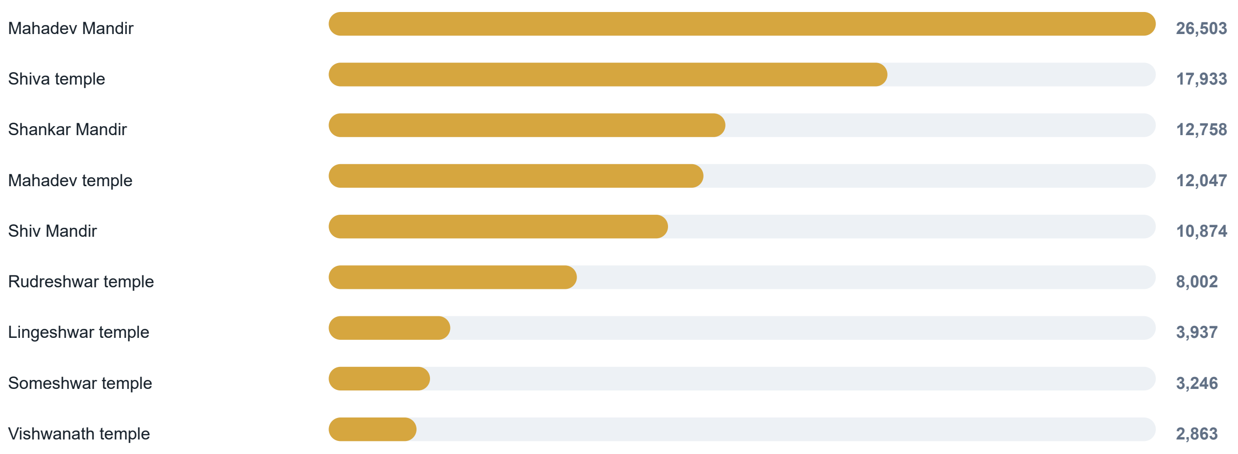
Madhya Pradesh	Indore	263	55.3%	476
Uttar Pradesh	Gorakhpur	263	49.9%	527

Query Signal

Last Recorded Source Query Keywords



How To Read This

The keyword distribution comes from **candidate_review.csv**. Because candidates are deduplicated by Google Place ID and rediscovery can update the stored source query, this is best read as the latest recorded query signal for unique candidate rows, not as full attribution across every API occurrence.

The strongest keyword signals in this export are direct Shiva and Mahadev variants, followed by Shankar and other configured Phase 1 terms.

KEYWORD	CANDIDATE ROWS	SHARE OF UNIQUE
Mahadev Mandir	26,503	27.0%
Shiva temple	17,933	18.3%
Shankar Mandir	12,758	13.0%
Mahadev temple	12,047	12.3%
Shiv Mandir	10,874	11.1%
Rudreshwar temple	8,002	8.2%
Lingeshwar temple	3,937	4.0%
Someshwar temple	3,246	3.3%
Vishwanath temple	2,863	2.9%

Interpretation Notes

What This Report Is Good For

- Prioritizing states and districts for manual review.
- Spotting where duplicate discovery is heavy and deduplication is valuable.
- Understanding how much of the current candidate set has strong Shiva-name evidence.
- Choosing the next controlled Google Places discovery batches.

Limits And Caveats

- Google Places is a discovery source only. The output should be verified with additional sources before publication.
- Confidence is based primarily on discovered names. A low-confidence row may still be a Shiva temple.
- Google Place IDs help deduplicate API results, but they do not prove cultural completeness or canonical temple identity.
- Counts can change when more search tasks are run, when Google updates Places data, or when classification terms are refined.

Suggested Next Moves

- Review the highest-volume districts first, especially where high+medium share is strong.
- Sample low-confidence rows in high-volume states to improve classification terms.
- Run remaining pending search tasks in small batches and regenerate this PDF after each batch.
- Keep village-level expansion separate and intentional because it will rapidly increase task volume.

Input files: national_summary.csv, state_counts.csv, district_counts.csv, candidate_review.csv. Sample CSV files were intentionally excluded.
