

Shiva Temple Discovery Consolidated Insights

A single report generated from the non-sample CSV exports in **reports/**, summarizing Google Places discovery output, deduplication, confidence classification, and geographic concentration.

Important: these are discovery counts from Google Places API and name-based classification, not exact real-world temple counts or an official cultural census.

UNIQUE GOOGLE PLACE IDS

95,231

Deduplicated candidate records

HIGH-CONFIDENCE SHIVA

53,051

55.7% of unique candidates

HIGH + MEDIUM SIGNAL

62,080

65.2% of unique candidates

Executive Summary

DISCOVERED OCCURRENCES 325,670 Raw result-count total from completed search tasks	DUPLICATES REMOVED 230,439 70.8% of discovered occurrences	CANDIDATE EXPORT ROWS 95,231 Rows in candidate_review.csv
STATES / UTS 36 Rows in state_counts.csv	DISTRICT ROWS 775 Rows in district_counts.csv	LOW-CONFIDENCE POSSIBLE TEMPLES 33,151 34.8% of unique candidates

What The Data Says - The pipeline reduced 325,670 discovered occurrences to 95,231 unique Google Place IDs, which is a strong signal that cross-query deduplication is doing real work. 62,080 candidates are high or medium confidence by name classification, representing 65.2% of the unique candidate set. - The top five states by unique discovered candidates account for 49.8% of the current candidate set; the top ten account for 69.4%. Uttar Pradesh currently has the largest unique candidate volume, while Uttar Pradesh has the largest high-confidence count.	Confidence Mix High 55.7% Medium 9.5% Low 34.8% 53,051 High-confidence names 9,029 Medium-confidence names Low confidence is a review queue, not a negative label. It means the candidate name did not match the configured Shiva terms strongly enough.

Query Signal

Last Recorded Source Query Keywords

How To Read This

The keyword distribution comes from **candidate_review.csv**. Because candidates are deduplicated by Google Place ID and rediscovery can update the stored source query, this is best read as the latest recorded query signal for unique candidate rows, not as full attribution across every API occurrence.

The strongest keyword signals in this export are direct Shiva and Mahadev variants, followed by Shankar and other configured Phase 1 terms.

KEYWORD	CANDIDATE ROWS	SHARE OF UNIQUE
Mahadev Mandir	25,928	27.2%
Shiva temple	16,984	17.8%
Shankar Mandir	12,521	13.1%
Mahadev temple	11,704	12.3%
Shiv Mandir	10,257	10.8%
Rudreshwar temple	7,956	8.4%
Lingeswar temple	3,865	4.1%
Someshwar temple	3,194	3.4%
Vishwanath temple	2,822	3.0%

Interpretation Notes

What This Report Is Good For

- Prioritizing states and districts for manual review.
- Spotting where duplicate discovery is heavy and deduplication is valuable.
- Understanding how much of the current candidate set has strong Shiva-name evidence.
- Choosing the next controlled Google Places discovery batches.

Limits And Caveats

- Google Places is a discovery source only. The output should be verified with additional sources before publication.
- Confidence is based primarily on discovered names. A low-confidence row may still be a Shiva temple.
- Google Place IDs help deduplicate API results, but they do not prove cultural completeness or canonical temple identity.
- Counts can change when more search tasks are run, when Google updates Places data, or when classification terms are refined.

Suggested Next Moves

- Review the highest-volume districts first, especially where high+medium share is strong.
- Sample low-confidence rows in high-volume states to improve classification terms.
- Run remaining pending search tasks in small batches and regenerate this PDF after each batch.
- Keep village-level expansion separate and intentional because it will rapidly increase task volume.

Input files: national_summary.csv, state_counts.csv, district_counts.csv, candidate_review.csv. Sample CSV files were intentionally excluded.
